Excepto la variable attendance_pct, ninguna variable se ha imputado demasiado bien, pero la que se ha imputado muy mal es la de gpa que todos los valores se han imputado por debajo del resto de la distribución, esto no necesariamente está mal, precisamente una hipótesis era que los datos faltantes de gpa era MNAR porque podrías estar relacionados con valores bajode de gpa, pero no explicado por el resto de variables. En este caso, al tener en cuenta de forma multivariante toda la base de datos, ha imputado los valores de la variable como bajos desplazando así toda la distribución.

Por otro lado las dos variables cualitativas parece que se imputa de forma correcta.
